

# Forgotten Functions

## Problem ID: a13p04functioninfo

Steiner, the esteemed mathematics professor at Reykjavík University, has created numerous functions throughout his career. However, with old age, he has started to forget the names of these functions and what they do.

He now seeks your assistance in identifying and explaining their purposes.

Write a function named `get_function_info` that takes another function `f` as an input parameter and returns a string containing the name of `f` and its docstring.

### Input

The function should accept exactly one python function as a parameter.

### Output

The function should return a string with on the following form:

```
Name: (the name of the function)
-----
(the docstring of the function)
```

#### Sample Input 1

```
sum
```

#### Sample Output 1

```
Name: sum
-----

    Return the sum of a 'start' value (default: 0) plus an iterable of numbers

    When the iterable is empty, return the start value.
    This function is intended specifically for use with numeric values and may
    reject non-numeric types.
```
